

Discharge Summary (Synthetically generated, contains meaningless text)

Name	Johnny Vella
Birth Date	03/02/1985
Gender	male
Post Code	3340

Admission Date	10/19/2001
Discharge Date	07/08/2001

Medications

INSPRA
CEFPROZIL
DULOXETINE HYDROCHLORIDE
PHENYLEPHRINE HYDROCHLORIDE

The patient was diagnosed with Nonrheumatic pulmonary valve disorders and showed symptoms of a pulmonary embolism and a heart failure. The patient also had to be transported to a hospital to be treated. He needed two visits to the emergency room before he could be admitted. The patient was admitted to the hospital and discharged with good health. At the time of his admission to the hospital, he was told that he had been admitted for a pulmonary embolism and that the team at the hospital had had

The patient was given METHYLPREDNISOLONE. The administration of this substance (4 mg/kg) was associated with an increase in hepatic and renal function. After 6 weeks of treatment, patients had a 40% increase in the level of liver enzymes in urine, urine-normalising plasma levels of protein ($P < 0.001$), urea ($P < 0.05$) and hemoglobin ($P < 0.01$) and improved liver function in patients with
